- *Flash mentioned above is FLASH MEMORY*

# **Saving Configuration Data to** **FLASH Memory**

- Lap-Top and HyperTerminal no longer necessary for this task.
- Current intersection data becomes default data (i.e. preempt).
- Restore to factory defaults is used for starting over with a clean controller data base.

# Using the File Management Features

- Place signal into flashing operation, through the tech. flash switch.
- Select menu option desired by pressing the “YES” key and then “ENTER”
- Controller will warn you that a restart is required and ask “Are You Sure?”.
- Press “YES” key and cycle power on controller & reset conflict monitor.
